Method for preparation of Ag and Au nanoparticles by extract of lyophilised biomass of green algae <i>Parachlorella kessleri</i>	
<b>Description of the technology</b>	Silver (Ag) and gold (Au) nanoparticles are currently widely used in a variety of applications (from electronics to biomedicine); however, the procedures for their preparation is often environmentally unfriendly. The use of biological methods for their production is more acceptable from an environmental point of view; on the other hand it often results in poor control over their size or shape. Green microscopic algae are infrequently used for nanoparticle production. The subject of the innovation is a new method for the preparation of Ag and Au nanoparticles using an extract from lyophilised biomass of the alga <i>Parachlorella kessleri</i> . By mixing the extract with silver or gold solutions it is possible to prepare sufficiently stable spherical nanoparticles of Ag or nanoparticles of Au with a narrow size distribution.
<b>Keywords</b>	Green microscopic alga, nanoparticle production
<b>Stage of Development</b>	development of prototype
<b>Language of communication</b>	Slovak, English
<b>Contact point</b>	Pavol Jozef Šafárik University in Košice, Faculty of Science, Institute of Biology and Ecology, Department of Microbiology, Moyzesova 11, 04154 Košice, Slovak Republic, contact person: renata.bacarova@upjs.sk
<b>Notice</b>	<i>Project co-funded by European Union funds (ERDF and IPA)</i>
